Hiring Team
Enterpret
Bengaluru, India

Dear Hiring Team,

Enterpret turns messy customer feedback into a queryable source of truth. At my last internship, I built an AI pipeline that did exactly that for unstructured sports data. I am a Mining Engineering graduate from IIT BHU, but the work I actually chased for four years was code and backend systems.

While working at **COPIOUS**, I engineered a **VLM OCR pipeline** using **OpenRouter** to digitize complex FIBA scoresheets. I cut operator data-entry time by **73%** and slashed AI token costs by **91%** by implementing dynamic prompts and JSON key aliasing. I also know how to build infrastructure that handles real scale. For my project **TradeOrders**, I decoupled a **PostgreSQL** database using **Kafka** to eliminate I/O bottlenecks, scaling the matching engine to handle **18,800 requests per second** with zero dropped orders under peak load.

I want to work at Enterpret because your backend team is deeply invested in AI-native architecture and real-time inference. Building robust backend components for new AI features and scaling them for companies like **Canva** and **Notion** is exactly the kind of ownership I want in an internship.

I have attached my resume for a deeper look at my architecture work. I am ready to join the team onsite in Bangalore and would love to show you the code behind these systems.

Sincerely,
Saikat Das
